

AI E-Commerce Store Builder Platform

Complete Product Roadmap & Build Specification

1. Product Vision

Build an AI-powered SaaS platform that allows any non-technical user to create, launch, and manage a complete eCommerce store by simply describing their niche, target customer, products, style, and business goals.

The platform should function like:

“ChatGPT + Shopify + AI Product Manager + AI Marketing Assistant + Automated Store Operations.”

The user should be able to type:

“Build me an online store selling luxury pet accessories for dog owners in the United States.”

The platform should automatically generate:

- Brand name
- Store design
- Logo concept
- Color palette
- Homepage
- Product categories
- Product listings
- Product variations
- Pricing strategy
- Product descriptions
- SEO metadata
- Policies
- Checkout flow
- Email templates

- Basic marketing content
 - Order management system
 - AI customer support assistant
-

2. Core Platform Goal

The app should make eCommerce store creation so simple that a non-technical business owner can launch a professional niche store without knowing coding, design, product listing, pricing, fulfillment, SEO, or marketing.

The platform should support:

- Any niche
 - Multiple store templates
 - AI-generated product catalog
 - Dropshipping/product supplier integration
 - Manual product upload
 - AI product enrichment
 - Automated pricing
 - Automated product variation creation
 - Storefront publishing
 - Admin dashboard
 - Order management
 - Customer support automation
 - Marketing automation
-

3. Recommended Tech Stack

Frontend

Use:

- Next.js

- React
- Tailwind CSS
- ShadCN UI
- Framer Motion for animations
- Responsive mobile-first design

Backend

Use one of the following:

Preferred:

- Node.js with NestJS or Express

Alternative:

- Laravel API backend

Database

Use:

- PostgreSQL

ORM

Use:

- Prisma if using Node.js
- Eloquent if using Laravel

Authentication

Use:

- Clerk
or
- Auth.js
or
- Supabase Auth

Payments

Use:

- Stripe for SaaS billing
- Stripe Checkout for store customer payments
- Stripe Connect later for merchant payouts

AI

Use:

- OpenAI API for text generation, planning, chatbot, content generation
- Image generation API for logo/product/banner image generation
- Vector database for knowledge base/customer support

File Storage

Use:

- AWS S3
- Cloudflare R2
- Supabase Storage

Hosting

Use:

- Vercel for frontend
- Railway/Render/DigitalOcean/AWS for backend
- Supabase/Neon/RDS for PostgreSQL

4. User Types

The platform should support these roles:

Platform Owner / Super Admin

Can manage:

- All users
- All stores
- SaaS plans

- Billing
- AI usage
- Platform templates
- Supplier integrations
- Global settings

Store Owner

Can:

- Create stores
- Edit store design
- Approve AI-generated content
- Manage products
- Manage orders
- View analytics
- Configure payments
- Manage support tickets

Store Customer

Can:

- Browse products
- Add to cart
- Checkout
- Track orders
- Contact support
- Request returns/refunds

5. Core User Flow

Store Owner Flow

1. User signs up.
2. User selects “Create New Store.”
3. Platform asks for a prompt:

Describe the eCommerce store you want to build.

Include niche, target customer, preferred style, price range, and product types.

4. AI analyzes prompt.
5. AI generates a store blueprint.
6. User reviews/edits blueprint.
7. AI generates full store.
8. User reviews:
 - Brand
 - Design
 - Pages
 - Product categories
 - Product listings
 - Pricing
9. User connects domain/payment method.
10. User launches store.

6. Store Generation Wizard

The store creation process should have a simple wizard.

Step 1: Business Prompt

User enters:

I want to create an online store selling modern home office accessories for remote workers.

Step 2: AI Follow-Up Questions

AI asks:

- Who is your target customer?
- What price range do you want?
- Do you want premium, budget, luxury, playful, minimalist, or professional branding?
- Do you already have products?
- Do you want AI to source products?
- Do you want dropshipping, manual inventory, digital products, or hybrid?

Step 3: Store Blueprint

AI generates:

- Store name
- Brand positioning
- Target audience
- Product categories
- Suggested products
- Design style
- Homepage structure
- SEO strategy
- Pricing strategy
- Marketing angle

Step 4: Store Build

AI creates:

- Homepage
- Category pages
- Product pages
- About page
- Contact page
- FAQ page

- Shipping policy
- Return policy
- Privacy policy
- Terms of service

Step 5: Product Catalog

AI either:

- Generates sample products
- Imports supplier products
- Imports user CSV
- Allows manual product creation

Step 6: Launch Checklist

System verifies:

- Store name
- Domain/subdomain
- Products
- Pricing
- Payment gateway
- Shipping policy
- Refund policy
- Contact info
- Checkout
- Email notifications

7. Core Modules to Build

Module 1: AI Store Generator

This is the main feature.

The AI Store Generator should accept a user prompt and create a structured store blueprint.

It should generate:

- Store name ideas
- Final selected brand name
- Tagline
- Brand personality
- Color palette
- Font pairing
- Homepage hero copy
- Product categories
- Initial product catalog
- SEO structure
- Menu/navigation
- Store policies
- Email templates
- Marketing angles

Output should be saved as structured JSON, not just plain text.

Example JSON structure:

```
{  
  "store_name": "PawLuxe Co.",  
  "tagline": "Luxury essentials for modern dog owners",  
  "niche": "premium pet accessories",  
  "target_audience": "urban dog owners aged 25-45",  
  "brand_tone": "premium, warm, stylish",  
  "colors": {  
    "primary": "#111827",  
    "secondary": "#D4AF37",  
    "accent": "#F9FAFB"  
  }  
}
```

```
},  
"categories": [  
  "Dog Collars",  
  "Luxury Leashes",  
  "Pet Beds",  
  "Travel Accessories"  
],  
"homepage_sections": [  
  "hero",  
  "featured products",  
  "benefits",  
  "best sellers",  
  "testimonials",  
  "FAQ"  
]  
}
```

Module 2: Dynamic Storefront Builder

The system should generate storefronts from reusable components.

Needed page types:

- Homepage
- Product listing page
- Product detail page
- Category page
- Cart page
- Checkout page
- About page
- Contact page
- FAQ page
- Shipping policy
- Return policy

- Privacy policy
- Terms of service

Needed components:

- Hero section
- Product grid
- Featured collection
- Benefits section
- Testimonials
- FAQ accordion
- Newsletter signup
- Image banner
- Category cards
- Product cards
- Upsell section
- Announcement bar
- Footer
- Header/navigation

Each store should have:

- Custom branding
- Custom colors
- Custom fonts
- Custom homepage copy
- Mobile responsive layout
- SEO metadata

The platform should allow AI to generate product listings.

For each product, AI should create:

- Product title
- Short description
- Long description
- Bullet-point benefits
- Features
- Specifications
- Product tags
- Product category
- SEO title
- Meta description
- FAQ
- Suggested price
- Suggested compare-at price
- Suggested product images or placeholders
- Variants

Example variants:

- Size
- Color
- Material
- Quantity
- Style
- Bundle option

Allow users to add products through:

- Manual entry
- CSV upload
- Supplier API
- Shopify import
- WooCommerce import
- AliExpress-style import later
- CJ Dropshipping/Spocket-style integrations later

For MVP, build:

- Manual product creation
- CSV import
- AI product enrichment

For later phases, add:

- Supplier product search
- Supplier API integration
- Automated fulfillment

Module 5: Product Variation Manager

The system should support product variants.

Examples:

Product: Premium Dog Collar

Variants:

- Size: Small, Medium, Large
- Color: Black, Brown, Red
- Material: Leather, Nylon

Each variant should support:

- SKU

- Price
 - Compare-at price
 - Inventory quantity
 - Image
 - Weight
 - Supplier cost
 - Shipping cost
 - Profit margin
 - Availability
-

Module 6: AI Pricing Engine

The AI should recommend pricing based on:

- Supplier cost
- Shipping cost
- Desired margin
- Competitor-style positioning
- Product category
- Brand positioning
- Psychological pricing

Pricing rules:

Retail Price = Supplier Cost + Shipping Cost + Platform Margin + Desired Profit

AI should suggest:

- Retail price
- Compare-at price
- Bundle price
- Discount strategy

- Free shipping threshold

Example:

Supplier cost: \$12

Shipping: \$4

Target margin: 60%

Suggested retail price: \$39.99

Compare-at price: \$59.99

Module 7: AI Content Generator

The platform should generate:

- Product descriptions
- Homepage copy
- About page
- FAQs
- Policies
- Email templates
- Ad copy
- Social media captions
- Blog posts
- SEO titles
- Meta descriptions
- Category descriptions

Admin must be able to:

- Generate
- Regenerate
- Edit
- Approve

- Publish
-

Module 8: AI Brand Generator

The AI should create:

- Store name
- Tagline
- Brand story
- Brand voice
- Color palette
- Font pairing
- Logo concept
- Mission statement
- Customer promise
- Value proposition

Example:

Brand Name: DeskNova

Tagline: Smarter tools for modern workspaces

Tone: Clean, professional, minimal

Primary Color: Charcoal

Accent Color: Electric Blue

Module 9: Store Admin Dashboard

The store owner dashboard should include:

- Store overview
- Sales analytics
- Orders
- Products

- Customers
- AI assistant
- Store design
- Marketing
- Content
- Settings
- Billing
- Support tickets

Dashboard cards:

- Revenue
- Orders
- Conversion rate
- Average order value
- Top products
- Pending orders
- Refund requests
- Abandoned carts
- AI suggestions

Module 10: Order Management

Order system should include:

- Order ID
- Customer info
- Products purchased
- Payment status
- Fulfillment status

- Tracking number
- Supplier order ID
- Refund status
- Notes
- Timeline

Order statuses:

- Pending
- Paid
- Processing
- Awaiting fulfillment
- Fulfilled
- Shipped
- Delivered
- Cancelled
- Return requested
- Refunded

Module 11: Checkout System

MVP checkout should use Stripe.

Checkout should support:

- Product purchase
- Cart
- Tax placeholder
- Shipping placeholder
- Discount code
- Payment confirmation

- Order confirmation email

Later add:

- Multi-currency
 - Stripe Connect
 - Apple Pay
 - Google Pay
 - Klarna/Afterpay
 - Store-owner payout system
-

Module 12: AI Customer Support

Build an AI chatbot for each generated store.

The chatbot should answer:

- Product questions
- Order tracking questions
- Shipping questions
- Refund policy questions
- Return policy questions
- Size/variant questions
- General FAQ questions

The chatbot should connect to:

- Store policy data
- Product database
- Order database
- Customer records
- Support ticket system

Important MVP rule:

AI can answer questions, but it should not automatically approve refunds. Refund requests should become admin tickets.

Module 13: Marketing Automation

The platform should generate:

- Welcome email
- Abandoned cart email
- Post-purchase email
- Product launch email
- Discount campaign
- Facebook ad copy
- Google ad copy
- TikTok video script
- Instagram captions
- Blog post ideas

Later add:

- Email campaign scheduling
 - SMS marketing
 - Ad platform integrations
 - AI campaign optimization
-

Module 14: Analytics Engine

Track:

- Visitors
- Product views
- Add-to-cart rate

- Checkout rate
 - Conversion rate
 - Revenue
 - Refund rate
 - Best-selling products
 - Top traffic sources
 - Abandoned carts
 - AI recommendation performance
-

8. Multi-Tenant SaaS Architecture

The app must support multiple users and multiple stores.

Important:

Each store must have isolated data.

Database should include:

users

stores

store_members

store_settings

store_themes

store_pages

store_sections

products

product_variants

categories

collections

customers

orders

order_items

payments

shipments

refunds

returns
support_tickets
chat_messages
ai_generations
ai_prompts
analytics_events
subscriptions
plans
domains
integrations

Every major table should include:

store_id
created_at
updated_at

9. Suggested Database Schema

users

id
name
email
password_hash
role
created_at
updated_at

stores

id
owner_id
store_name
slug
domain
niche
target_audience
brand_tone
status

created_at
updated_at

store_themes

id
store_id
primary_color
secondary_color
accent_color
font_heading
font_body
logo_url
favicon_url
created_at
updated_at

products

id
store_id
category_id
title
slug
description
short_description
seo_title
meta_description
status
supplier_name
supplier_cost
retail_price
compare_at_price
profit_margin
inventory_status
created_at
updated_at

product_variants

id
product_id
sku
variant_name
option_1_name
option_1_value
option_2_name
option_2_value
price
compare_at_price
cost
inventory_quantity
image_url
created_at
updated_at

orders

id
store_id
customer_id
order_number
payment_status
fulfillment_status
subtotal
shipping_total
tax_total
discount_total
grand_total
tracking_number
created_at
updated_at

ai_generations

id
store_id
user_id
generation_type
prompt

response_json
status
created_at
updated_at

support_tickets

id
store_id
customer_id
order_id
subject
status
priority
assigned_to
created_at
updated_at

10. AI Workflows

Workflow A: Generate Store From Prompt

User enters business idea
↓
AI analyzes niche
↓
AI asks clarifying questions
↓
AI creates store blueprint
↓
User approves blueprint
↓
System creates store records
↓
AI generates pages, categories, products, policies
↓
Store preview is created
↓
User edits/approves

↓

Store launches

Workflow B: Generate Products

User selects niche/category

↓

AI suggests products

↓

AI creates product titles/descriptions

↓

AI creates variants

↓

AI recommends pricing

↓

User approves products

↓

Products publish to storefront

Workflow C: Product Import + AI Optimization

User uploads CSV or imports product

↓

System reads product data

↓

AI rewrites title and description

↓

AI creates tags and category

↓

AI suggests price

↓

AI creates SEO metadata

↓

User approves

↓

Product is published

Workflow D: Order Management

Customer places order

↓

Stripe payment succeeds

↓

Order is created

↓

Customer receives confirmation email

↓

Admin sees order in dashboard

↓

Order is manually or automatically fulfilled

↓

Tracking is added

↓

Customer receives tracking email

Workflow E: AI Customer Support

Customer asks question

↓

AI identifies intent

↓

AI checks store policy/product/order data

↓

AI provides answer

↓

If sensitive issue → create ticket

↓

Admin reviews ticket

11. MVP Build Scope

MVP Version 1 Should Include

Build these first:

- User authentication

- Store creation wizard
- AI store blueprint generator
- AI brand generator
- Dynamic storefront builder
- Product management
- Product variant management
- AI product description generator
- AI pricing suggestion
- Product category pages
- Cart
- Stripe checkout
- Order management
- Basic customer support chatbot
- Admin dashboard
- Store preview
- Store publishing to subdomain
- Basic email notifications

Do Not Build in MVP

Delay these:

- Fully automated supplier ordering
- Complex dropshipping integrations
- Advanced ad automation
- Mobile app
- Multi-language support
- Complex tax automation

- Full accounting integration
 - AI autonomous refund approval
 - Real-time competitor scraping
-

12. Phase-by-Phase Roadmap

Phase 1: Foundation

Goal: Build SaaS platform foundation.

Features:

- Authentication
- User dashboard
- Store creation
- Multi-store support
- Store settings
- Theme settings
- Database structure
- Basic admin dashboard

Deliverable:

User can sign up, create a store, and access a dashboard.

Phase 2: AI Store Generator

Goal: Let users generate a store from a prompt.

Features:

- AI prompt input
- AI clarifying questions
- Store blueprint JSON
- Brand generator

- Homepage generator
- Page generator
- Category generator
- Policy generator

Deliverable:

User can enter a niche and receive a generated store preview.

Phase 3: Product Engine

Goal: Allow AI-assisted product creation and management.

Features:

- Product CRUD
- Category CRUD
- Variant management
- AI title generator
- AI description generator
- AI pricing recommendation
- AI SEO metadata generator
- CSV product import

Deliverable:

User can generate or import products and publish them to the store.

Phase 4: Storefront Builder

Goal: Build customer-facing store.

Features:

- Public storefront
- Homepage

- Category pages
- Product pages
- Cart
- Checkout
- Responsive design
- SEO metadata
- Store theme system

Deliverable:

Generated stores are publicly viewable and shoppable.

Phase 5: Checkout & Orders

Goal: Allow real purchases.

Features:

- Stripe checkout
- Order creation
- Order confirmation email
- Admin order dashboard
- Payment status
- Fulfillment status
- Tracking number field

Deliverable:

Customers can purchase products, and store owners can manage orders.

Phase 6: AI Customer Support

Goal: Automate basic support.

Features:

- Store chatbot
- FAQ integration
- Product Q&A
- Order lookup
- Return/refund ticket creation
- Admin support inbox

Deliverable:

Customers can ask questions and receive AI-powered support.

Phase 7: Marketing Tools

Goal: Help users promote their store.

Features:

- AI email generator
- AI ad copy generator
- AI social caption generator
- Blog generator
- Landing page copy generator
- Abandoned cart emails

Deliverable:

Store owners can generate marketing assets inside the dashboard.

Phase 8: Supplier Automation

Goal: Move toward true automation.

Features:

- Supplier integrations
- Product sourcing

- Product import from supplier
- Inventory sync
- Supplier order placement
- Tracking sync

Deliverable:

Store owners can source and fulfill products more automatically.

Phase 9: Advanced AI Optimization

Goal: Make platform smarter over time.

Features:

- Conversion analytics
- AI product recommendations
- AI pricing optimization
- AI layout suggestions
- AI abandoned cart optimization
- Best/worst product detection
- AI growth recommendations

Deliverable:

The platform suggests improvements automatically.

13. UI/UX Requirements

Design should be:

- Clean
- Modern
- Minimal
- Beginner-friendly

- Mobile responsive
- SaaS-style
- Dashboard-focused
- Chat-first for AI actions

Important UX principle:

User should never feel like they are configuring software. They should feel like they are talking to an AI business assistant.

Main navigation:

Dashboard
AI Builder
Storefront
Products
Orders
Customers
Marketing
Support
Analytics
Settings
Billing

14. AI Assistant Behavior

The in-app AI assistant should help users with:

- Building store
- Editing design
- Creating products
- Writing descriptions
- Pricing
- SEO
- Marketing

- Support responses
- Store improvement suggestions

Example user command:

Add 10 premium pet bed products to my store and price them with a 55% margin.

AI should:

1. Understand request
 2. Generate products
 3. Create variants
 4. Suggest pricing
 5. Show preview
 6. Ask for approval before publishing
-

15. Approval System

AI should not publish major changes without approval.

Require approval for:

- Publishing products
 - Changing prices
 - Publishing pages
 - Sending marketing emails
 - Issuing refunds
 - Changing policies
 - Deleting products
 - Launching store
-

16. SaaS Subscription Plans

Suggested plans:

Starter

- 1 store
- 50 products
- Basic AI generation
- Basic storefront
- Manual fulfillment

Pro

- 3 stores
- 500 products
- Advanced AI generation
- Marketing tools
- AI chatbot
- Analytics

Business

- 10 stores
- Unlimited products
- Supplier integrations
- Advanced automation
- Team members
- Priority support

17. Admin Control Panel

Super admin should manage:

- Users
- Stores
- Subscriptions

- AI usage
 - Failed AI requests
 - Platform templates
 - Store templates
 - Supplier integrations
 - Billing
 - Abuse monitoring
-

18. Security Requirements

Include:

- Secure authentication
 - Role-based permissions
 - Store data isolation
 - Payment handled by Stripe
 - API key encryption
 - Rate limits
 - Input validation
 - Admin audit logs
 - AI action logs
-

19. Legal/Compliance Pages

Each generated store should include:

- Privacy policy
- Terms of service
- Refund policy
- Shipping policy

- Contact page
- Disclaimer

The platform should allow store owners to edit and approve these.

20. Acceptance Criteria

The MVP is complete when:

- A user can sign up
- A user can create a store from a prompt
- AI generates a complete store blueprint
- AI creates brand, pages, categories, and sample products
- User can edit products
- User can manage variants
- User can accept Stripe payments
- Customer can complete checkout
- Store owner can view orders
- AI can generate product content
- AI chatbot can answer basic customer questions
- Store can be published to a unique subdomain

21. Master Prompt for AI Builder

Copy and paste this:

Build a full-stack SaaS platform called an AI E-Commerce Store Builder.

The purpose of the platform is to allow non-technical users to create, launch, and manage complete eCommerce stores from simple prompts.

The user should be able to describe a business niche, target audience, product type, branding style, and pricing preference. The AI should then generate a complete store

blueprint including brand name, tagline, color palette, font recommendations, homepage structure, product categories, sample products, product descriptions, SEO metadata, policies, and marketing copy.

Use Next.js, React, Tailwind CSS, ShadCN UI, Node.js/NestJS or Express backend, PostgreSQL database, Prisma ORM, Stripe for payments, and OpenAI API for AI generation.

The app must be multi-tenant, meaning one platform account can create and manage one or multiple stores. Each store must have isolated products, orders, customers, pages, settings, and analytics.

Build the following core modules:

1. User authentication
2. SaaS dashboard
3. Store creation wizard
4. AI prompt-based store generator
5. Store blueprint generator
6. AI brand generator
7. Dynamic storefront builder
8. Product management
9. Product variant management
10. AI product title and description generator
11. AI pricing recommendation engine
12. Category and collection management
13. Cart and checkout
14. Stripe payment integration
15. Order management
16. Customer management
17. AI customer support chatbot
18. Support ticket system
19. AI marketing content generator
20. Analytics dashboard
21. Store settings
22. Theme customization
23. Store publishing to subdomain
24. Super admin panel

The user experience should be extremely simple. The main interface should feel like chatting with an AI business assistant. A non-technical user should be able to type a request such as:

“Build me a luxury dog accessories store for dog owners in the United States with premium branding and products priced between \$30 and \$150.”

The platform should generate a full store preview from that prompt.

Do not allow AI to automatically publish major changes without user approval. Product publishing, price changes, policy changes, marketing emails, refunds, and store launch should require approval.

Build the MVP first with:

- Authentication
- Store creation
- AI store blueprint
- AI brand generation
- Generated storefront
- Product CRUD
- Product variant CRUD
- AI product descriptions
- AI pricing suggestions
- Cart
- Stripe checkout
- Order management
- Basic AI chatbot
- Store preview and publishing

Make the design clean, modern, mobile-first, and beginner-friendly.

22. Best Build Strategy

Start with the **AI store builder**, not supplier automation.

The first goal is:

Can a user type a niche and get a professional store generated?

Once that works, add:

1. Product import
2. Supplier automation
3. Marketing automation
4. Full operational automation
